

CERTIFICATS SSL

INTRODUCTION

The BlueMind servers use certificate-based authentication. The certificates generated during the installation of BlueMind can be replaced by customized certificates on a single-server installation.

PREREQUISITES

In order to set up an SSL certificate, you need the following files:

- a file containing the new SSL certificate
- a file containing the private key for the new certificate
- a file containing the certificate from the certificate authority responsible for issuing the new SSL certificate

INSTALLING THE CERTIFICATE

- Connect to BlueMind as admin0 and access the admin console
- Go to the page Security > Modify Certificate
- Use the three "Parcourir" ("Browse") buttons to find the files required and send them to the server:

The screenshot shows the BlueMind administration interface. At the top, there is a navigation bar with the BlueMind logo, the text 'Messagerie & espaces collaboratifs', and user options 'Admin | Logout'. Below the navigation bar, there is a breadcrumb trail: 'Central administration > Security > Modify Certificate'. On the left side, there is a sidebar menu with categories: 'Directories', 'System Management', 'Security' (highlighted), 'Backup and Restore', and 'Reports and statistics'. The main content area is titled 'Modify Certificate' and contains the following text: 'The certificate will be deployed on all BlueMind server components, including mail servers. Be sure to use a certificate matching the external url of your installation.' Below this text, there are three rows of input fields, each with a 'Parcourir...' (Browse) button and a status message: 'Aucun fichier sélectionné.' The rows are labeled 'Certificate authority', 'Certificate', and 'Private key'. At the bottom of the form, there are two buttons: 'Save' and 'Cancel'.

- Click "Save" to upload the files and apply the new certificate.
