

CONFIGURATION PERSONNALISEE DE NGINX

INTRODUCTION

Nginx virtual host files (such as `/etc/nginx/sites-enabled/bm-client-access`) are managed by BlueMind and **must absolutely not be modified**.

These files are replaced during system updates, as a result, all local modifications are lost.

You can, however, add configuration files into `/etc/nginx/sites-enabled/` to customize configuration.

X-FRAME-OPTION CONFIGURATION

By default, BlueMind can be included into a *frame*.

This behavior can be changed by adding the *X-Frame-Options* HTTP header to Nginx responses.

```
~$ sudo sh -c 'echo "add_header X-Frame-Options DENY;" >> /etc/nginx/sites-enabled/configuration.local'  
~$ sudo /etc/init.d/nginx restart
```

For more information on the *X-Frame-Options* response header, please refer to the [Mozilla documentation](#).
